Introduction

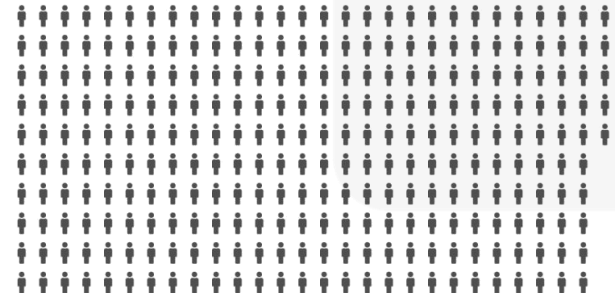

- Suicide is a major public health issue around the world, being the second cause of death in young people (especially under 24 years)

For every suicide death, there are*

 **4** Hospitalizations for suicide attempts**

 **8** Emergency department visits related to suicide**

 **27** Self-reported suicide attempts***

 **275** People who seriously considered suicide***

* Based on the latest year of available data for adults ages 18 and older.

*** Source: [2020 SAMHSA's National Survey on Drug Use and Health](#)  

Introduction

- Spain ranked 130th of the 170 countries listed according to WHO's suicide report.
- A particular suicided case in Spain is "Suicides for eviction", i.e. linked to issues relating to housing and mortgage debt, where 34% of the suicides result from them
- Sometimes the link between eviction and suicide is **unknown**, and as in most suicides, is due to complex and difficult personal situations.

Suicide Rates Around the World

Estimated rate of suicide per 100,000 population in selected countries in 2019

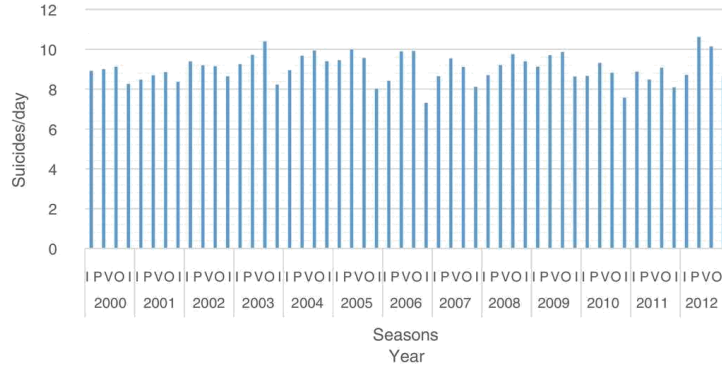

Source: WHO

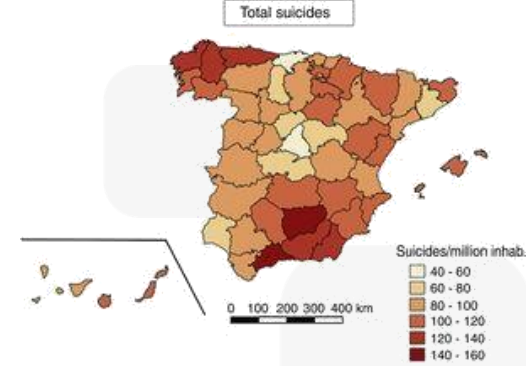

Insights about Suicides in Spain

- Region dependence
- Gender dependence
- Seasonal, monthly and weekly pattern

Rev Psiquiatr Salud Ment. 2018;11:192-8

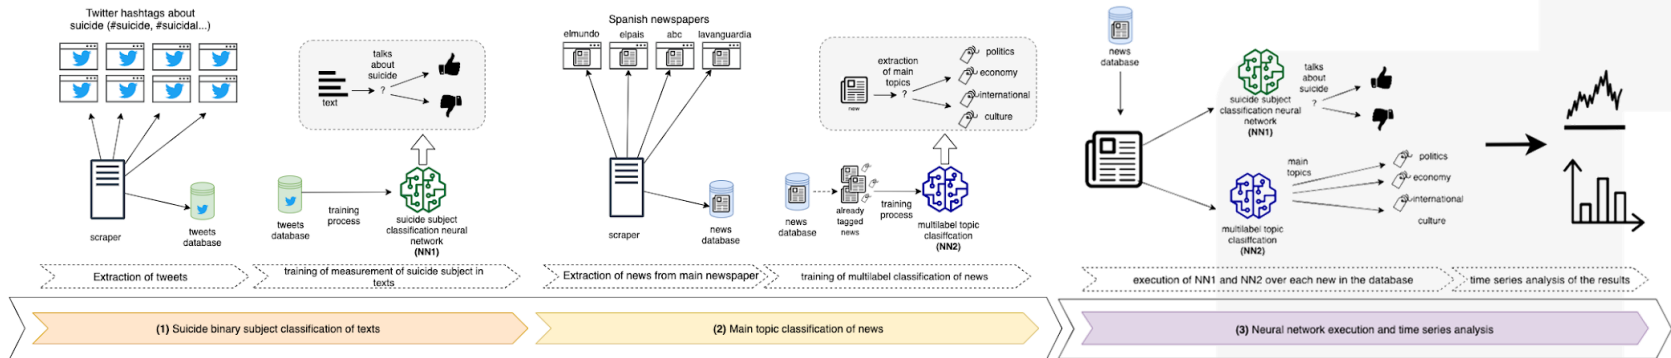

Our Focus

- Papageno effect is a protective effect on suicidal behavior determined by overcoming facts on suicide and empathetic responses to people suffering suicidal ideation
- News media are key to understanding how the population reacts to a certain topic
- The role of suicide-related media have led to the creation of guidelines for media reporting
- The main aim of this research is to get a better knowledge of suicides-related contagion publishing in Spanish Media using NLP

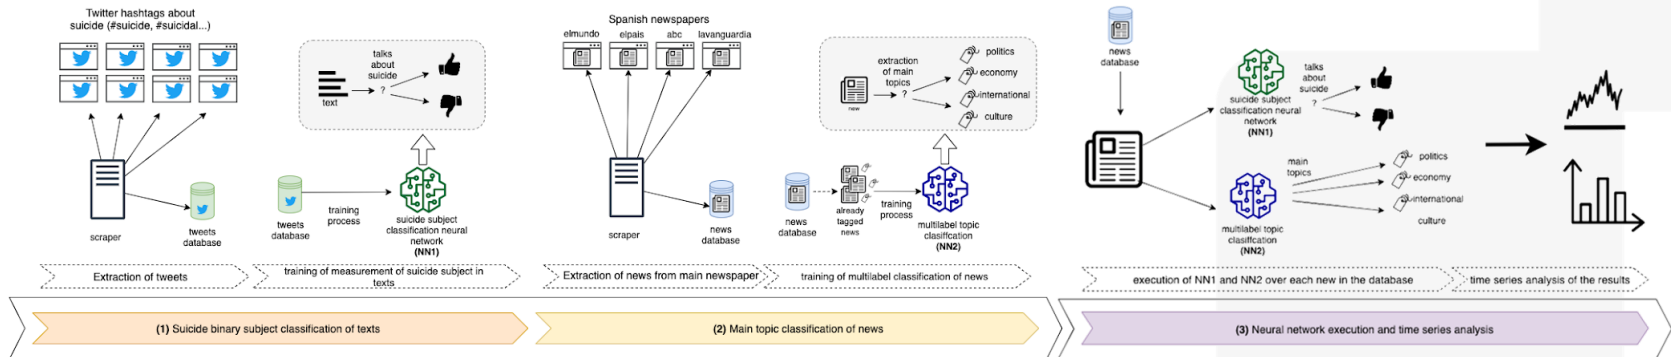

Methodology

Workflow of the topic classification process.

Methodology

Workflow of the topic classification process.

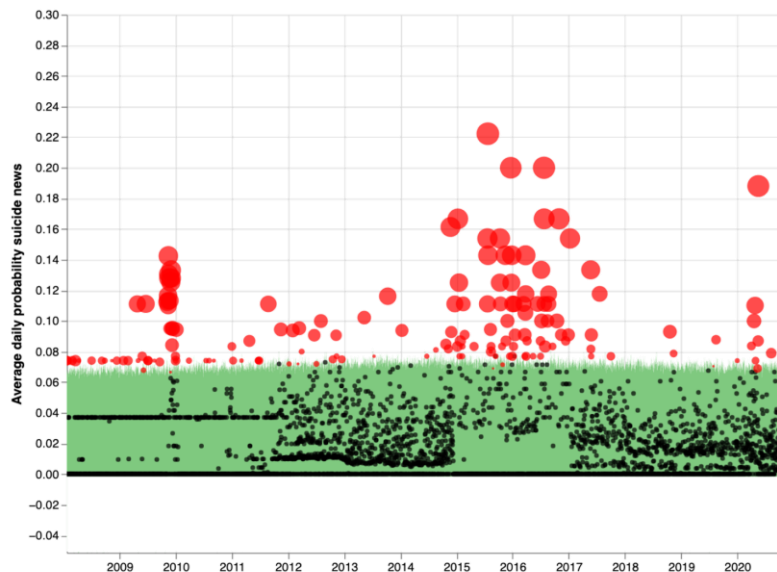

The impact of mediatic suicide cases

To understand the press coverage of suicide in more detail, we analyze the suicide subject probability over time, i.e. the temporal changes

Anomalies detection

The temporal variation of the average daily probability of suicide contagion in news (black simbols) , the Porophet fitting curve (green lines), and the anomalies points (red symbols).

Date	Suicide subject average probability	Event
2015-07-24	0.22	The news refer to the death by suicide of a black woman in EEUU after being detained. https://elpais.com/internacional/2015/07/24/actualidad/1437730718_661809.html https://www.abc.es/videos-otros/20150722/joven-negra-aparece-ahorcada-4369825582001.html
2015-12-20	0.20	The news cover a gang rape in which one of the five rapists died by suicide in jail. https://www.publico.es/internacional/menor-involucrado-violacion-grupo-nueva.html https://en.wikipedia.org/wiki/2012_Delhi_gang_rape_and_murder
2016-07-23	0.20	German-Iranian terrorist dies by suicide after killing nine https://www.publico.es/internacional/atacante-munich-suicidio-disparo-policia.html

Heatmap

The high probabilities of suicide subject not only correspond to the anomaly day, but pop up over the course of several days, i.e. a relevant event remains on the news over time .

2015

2016

2017

2018

Intrinsic thematic relationship of suicide news

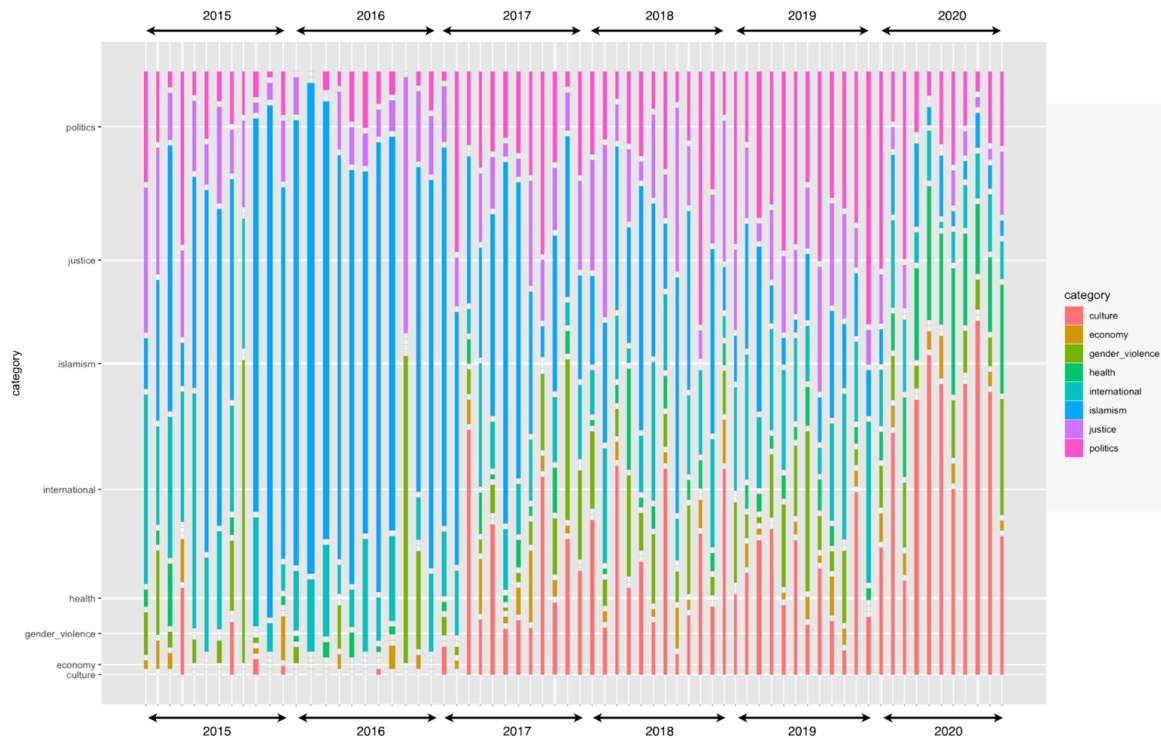

Intrinsic connection of subjects (or tags) in the news.

We extract how likely is that each news address suicide topics by a suicide subject binary classification

Intrinsic thematic relationship of suicide news

Despite that over the years the main topics which a suicided connotation do not change, the percentage of them does.

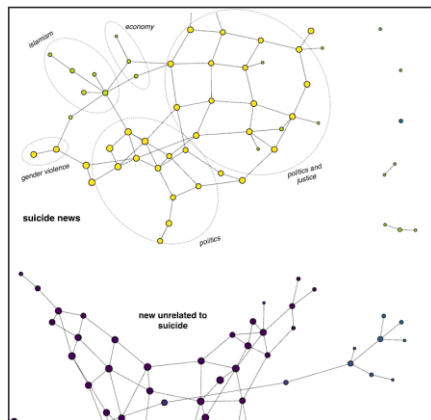

Interdependent between topics

The fundamental assumption in topology is that the way in which the parts of a system are connected is more important than distance. Mapper algorithm

2019

Conclusions

- We have focused on **extrapolate the effect of mediatic suicide cases** in the **reporting of suicide news**.
- Based on the hypothetical protective effect and in order to prevent contagion (**Papageno effect**), the WHO (World Health Organization) **developed guidelines and recommendations for the news media professionals** to ameliorate the elaboration of news on suicide
- **Suicide tends to be connected** by the media with the subject “politics”, “justice”, “culture”, “Islamism” and “gender violence” and rarely with the subject “health”
- This finding may set a new point of view and representation of the news about suicide that would **lead to better reporting**.
